CORRECTION TO BULLETIN 78/2

Examination of the tables on viral isolates produced in Bulletin 78/2 will readily demonstrate a rather glaring error, namely, the totals in the source tissue tables are approximately twice those of the breakdown by State.

It is not necessary that the totals in the 2 sections agree, since it is possible for most of the viruses to be identified in more than one source tissue. The probability, however, of every isolate being found in more than one source tissue is rather small, so that the mistake has been traced to a programming error.

This has been rectified, and replacement pages for the source tissue tables for Period 78/2 are enclosed.

PROVISION OF INFORMATION BY CDI

Now that the virus reports are entered onto the computer it is comparatively simple for us to produce additional tables from them. The items recorded are:

- laboratory
- sex
- age
- patient or survey subject
- firm or provisional clinical diagnosis
- date of collection of specimen
- specimen during life or post-mortem
- source tissue(s) of specimen
- method of isolation
- method of direct identification
- serological technique
- criterion for positive serological diagnosis
- virus or viral antigen, including type.

Tables involving any combination of these items since the first period in 1978, will be produced on request. Listings of cases satisfying specified criteria can also be produced, but for reasons of confidentiality the identity of the patient will be available only through the laboratory submitting the report. For the present at least these services will be free of charge. Enquiries are welcomed.

REPORT ON FOOD POISONING INCIDENT (contributed by Dr W.A. Lopez,  
Health Commission of N.S.W.)

On 26 January 1978, eighty-two cases of food poisoning occurred in the 155 members of a commercial type laundry operated by a jail in Sydney. The laundry is operated by a permanent staff of prison officers, who administer and supervise the work of prisoners who are brought in daily from three other prisons located many miles away.

Both staff and prisoners eat the same food which is prepared daily in a kitchen in the laundry premises. Lunch which was served at 12.30 p.m. on the 25 January consisted of rump steak, onion sauce, mashed potatoes, peas, beans, sponge pudding with custard (made from dry custard powder reconstituted by the addition of warm milk) and tea or coffee.

The first symptoms occurred from about 2 a.m. to 6 a.m. on the 26 January, and consisted of abdominal pain and frequent watery diarrhoea. A few complained of nausea, but none vomited. In most cases the symptoms had abated by the evening. The only item of the lunch served on the 25th remaining for examination on the 26th, was a little of the prepared custard which had been stored in a refrigerator.

One stool and 13 rectal swabs from patients were sent for culture.

The dry custard powder showed only 400 *B. cereus* per G., but the reconstituted custard powder from the previous day showed  $3 \times 10^6$  *B. cereus* per G.

Eleven out of the 13 stool cultures showed high numbers of *Cl. perfringens* of a *B. haemolytic* heat labile strain.

INFLUENZA B VIRUS IN FAECES (contributed by staff at Fairfield  
Hospital)

The unusual isolation of Influenza B virus in the tables from a faecal specimen is from a 47-year old woman with bronchitis.

This patient had a history of multiple abdominal surgical procedures and this may have contributed to a respiratory virus surviving in her gastro-intestinal tract. The virus was re-isolated from the original specimen to minimize the chance of laboratory cross-infection, and the patient is being further investigated.
